

Commercial LOB Workflow Dashboard

Fresh Case & Returning Case Workflow Tasks, Underwriting Routing, Accumulation and Reinsurance Visualization

Prepared as a functional design concept for Commercial Lines underwriting operations

Design Goal

Provide one operational view where users can classify risks as Preferred, Referred or Deferred; automatically route quotations based on underwriting authority; monitor location-based accumulation using latitude and longitude; recommend reinsurance actions based on company capacity; and track quotation progress with clear next steps.

Capability	What the dashboard should answer
Risk classification	Is this quote Preferred, Referred or Deferred, and why?
UW routing	Who should review this quotation based on authority, risk category and limit?
Accumulation	What exposure already exists near this latitude and longitude?
Capacity	Does this quotation fit within company capacity, retention or treaty?
Progress tracking	Where is the quotation now and what must be completed next?

Document Contents

1. Workflow design principles
2. Fresh Case workflow tasks and visualizations
3. Returning Case workflow tasks and visualizations
4. Risk categorization and routing logic
5. Underwriting hierarchy and approval routing
6. Accumulation and geospatial exposure visualization
7. Capacity and reinsurance recommendation model
8. Quotation progress tracking and next-best-action design
9. Recommended dashboard layout

1. Workflow Design Principles

Core Principle

A fresh case needs completion guidance. A returning case needs change intelligence. The same dashboard should support both journeys through a Case Type toggle and context-aware task panels.

- Classify every commercial quotation into Preferred, Referred or Deferred based on configured underwriting appetite, exposure, claims, occupancy, geography and sum insured.
- Route quotations automatically to the correct underwriter level based on underwriting authority limits, risk category and capacity impact.
- Use latitude and longitude to plot risk locations, detect accumulation hotspots and quantify surrounding Total Insured Value exposure.
- Suggest reinsurance requirements by comparing the quotation and accumulated exposure against company capacity, retention, treaty and facultative thresholds.
- Expose status, blockers, SLA and next steps so the user always understands quotation progress and remaining actions.

2. Fresh Case Workflow Tasks

A Fresh Case is a new quotation where the insurer has limited or no active underwriting history for the client, premises or risk location. The objective is to complete intake, assess the risk, route it correctly, validate capacity and issue or defer the quote.

Stage	Key Workflow Tasks	Recommended Visualization
Quote Intake	Capture client, LOB, occupancy, construction, address, coordinates, coverages, sum insured, broker/agent and requested quote date.	Intake completion meter with missing-field warnings
Document Collection	Upload proposal form, risk photos, valuation, fire protection details, prior policy, declarations and supporting documents.	Document checklist with mandatory/optional badges
Risk Scoring	Score risk using occupation, construction, TIV, location hazard, claims declaration, protection measures and underwriting appetite.	Risk score gauge with reason chips
Risk Categorization	Classify the case as Preferred, Referred or Deferred. Capture system-generated reasons and manual override if applicable.	Category decision tile with color-coded reason
UW Routing	Assign to auto approval, preferred risk underwriter, junior, senior, manager or head of underwriting based on authority.	Underwriting hierarchy ladder with current quote highlighted
Accumulation Check	Plot risk coordinates and calculate exposure concentration by radius, region, hazard zone and peril.	Map heat layer with exposure bubbles and radius selector
Capacity Check	Compare quote TIV and accumulated exposure against company capacity, retention and available limit.	Capacity gauge and remaining capacity card
Reinsurance Check	Recommend within retention, treaty applicable, facultative reinsurance required or reinsurance team escalation.	Reinsurance recommendation card with rule explanation
UW Decision	Approve, request clarification, escalate, defer, decline or release quotation based	Decision panel with approval path and audit trail

	on underwriting outcome.	
Quote Release	Generate quote documents, terms, conditions and premium; release to broker/customer.	Release-ready checklist and final action button

Fresh Case - Suggested Progress Tracker

Stepper Sequence

Submitted -> Documents Pending -> Risk Scored -> Underwriter Assigned -> Capacity Checked -> Reinsurance Reviewed -> Approved / Deferred / Issued

3. Returning Case Workflow Tasks

A Returning Case may be a renewal, endorsement, revised quotation or resubmission. The objective is to compare the current request with prior underwriting history and focus attention on changes, exceptions and capacity impact.

Stage	Key Workflow Tasks	Recommended Visualization
Case Retrieval	Fetch previous quote/policy, prior underwriting notes, claims history, expiring terms, previous location and previous reinsurance decision.	Case history snapshot with previous decision
Change Detection	Compare current submission with previous data across TIV, occupancy, address, coordinates, covers, limits, claims and broker remarks.	What Changed? comparison panel
Risk Revalidation	Recalculate risk score and compare it with the previous score and prior appetite result.	Previous vs current score trend
Category Movement	Check whether the risk remains Preferred/Referred/Deferred or has moved to another category.	Category movement indicator: improved, unchanged or deteriorated
Smart Routing	Auto-route only when authority, exposure, category or exceptions have changed; otherwise suggest previous owner/fast-track.	Routing suggestion with reason
Accumulation Refresh	Recalculate exposure at the same or updated coordinates and identify incremental accumulation impact.	Before/after accumulation map and exposure delta
Capacity Impact	Show incremental capacity consumed by the returning case and whether previous capacity position remains valid.	Delta capacity card
Reinsurance Recheck	Determine whether prior treaty remains valid or facultative/renewed reinsurance review is required.	Reinsurance continuity panel
UW Decision	Approve as expiring terms, revise terms, request documents, escalate, defer or decline.	Decision recommendation with audit trail
Quote Release	Release renewal/revised quotation and store changes, approvals and notes in the case timeline.	Release readiness and timeline log

Returning Case - Suggested Progress Tracker

Stepper Sequence

Case Retrieved -> Changes Identified -> Risk Revalidated -> Underwriter Review -> Capacity Rechecked -> Terms Revised -> Approved / Released

4. Fresh Case vs Returning Case Dashboard Focus

Dashboard Area	Fresh Case Focus	Returning Case Focus
Case Summary	Missing information, first-time score, SLA and assigned underwriter.	Previous policy, current quote, prior decision, changes and renewal/resubmission status.
Risk Category	Initial Preferred/Referred/Deferred decision with reason.	Category movement from previous to current state.
Documents	Mandatory documents required to begin underwriting.	Only changed, expired or additional documents required.
Routing	Authority-based first assignment.	Reuse previous owner or reroute only when authority/exposure changes.
Accumulation	New location exposure and radius-based concentration.	Before/after exposure comparison and incremental TIV impact.
Reinsurance	First recommendation based on retention, treaty and facultative thresholds.	Continuity check against prior reinsurance terms and changed capacity position.
Next Steps	Complete missing details, validate risk and obtain approvals.	Review changes, validate exceptions and release renewal/revised terms.

5. Risk Categorization Model

Risk Category	Meaning	Typical System Indicators	Primary User Action
Preferred	Risk is within appetite, authority and capacity.	Clean occupancy, acceptable hazard zone, no material claims, TIV within authority and low accumulation.	Fast-track or approve within authority.
Referred	Risk needs underwriter review or higher authority.	TIV exceeds lower authority, medium hazard, claims indicator, special coverage, high accumulation or manual exception.	Route to relevant UW level and complete review tasks.
Deferred	Risk cannot progress until blocker is resolved or falls outside appetite.	Prohibited occupancy, missing mandatory documents, severe hazard zone, capacity breach or unacceptable claims/loss history.	Request clarification, escalate or decline/defer quote.

Design Recommendation

Every category badge should display a reason code. Example: Referred - TIV exceeds Junior Underwriter authority and location falls within high accumulation zone.

6. Underwriting Hierarchy & Routing Logic

UW Level	Authority Limit Example	Risk Types Routed	Dashboard Cue
Auto Approval Engine	Up to configured low-risk limit	Preferred cases with no exceptions.	Auto-approved badge and release-ready action.
Preferred Risk Underwriter	Up to 50L or configured limit	Preferred risks requiring basic validation.	Green routing row and low workload indicator.
Junior Underwriter	Up to 1Cr	Low to moderate referred risks.	Amber route with authority check.
Senior Underwriter	1Cr to 5Cr	Medium/high complexity or higher TIV risks.	Highlighted current owner if quote exceeds junior limit.
Underwriting Manager	5Cr to 25Cr	High value, high accumulation or exception cases.	Escalation badge and SLA timer.
Head of Underwriting	Above 25Cr / exceptional cases	Large, complex, deferred or appetite exception cases.	Red escalation row with approval dependency.
Reinsurance Team	As per capacity breach or treaty rule	Cases requiring treaty/facultative review.	Reinsurance dependency and pending decision status.

Routing Decision Rules

- Route by the highest applicable rule: risk category, sum insured/TIV, accumulation exposure, hazard zone, claims indicator, special coverage and reinsurance dependency.
- Show why the current underwriter was selected, not just who was selected.
- Display authority breach clearly when the assigned user cannot approve the quotation independently.
- Allow reassignment with reason and audit trail for governance.

7. Accumulation & Geospatial Exposure Visualization

Purpose

The map should convert latitude and longitude into underwriting intelligence: where the risk is located, what exposure already exists nearby, whether the area is a hotspot, and whether capacity or reinsurance action is required.

Map Element	What It Shows	Why It Helps UW Team
Current Risk Pin	Exact risk location from quote latitude and longitude.	Confirms geography and validates whether coordinates are usable.
Exposure Bubbles	Nearby risks grouped by radius, postal code, city or zone.	Shows concentration and accumulation pressure.
Heat Layer	Low, medium and high exposure density.	Helps identify hotspots visually.
Radius Selector	Exposure within 1 km, 5 km, 10 km or configured range.	Supports underwriting and treaty rules.
Hazard / Cat Zone	Flood, wind, earthquake, fire or other peril zones.	Connects risk location with catastrophe exposure.
Exposure Summary	Number of risks, total TIV, remaining capacity and top perils.	Turns the map into an actionable decision panel.

Metric	Example Value	Interpretation
Nearby Risks	38	Number of insured risks within configured radius.
Total TIV Exposure	125Cr	Total insured value already accumulated around the location.
Company Capacity	150Cr	Available underwriting capacity for the zone/peril.
Remaining Capacity	25Cr	Capacity left after considering existing

Exposure Level	High	exposure. Requires senior UW and possible reinsurance review.
Suggested Action	Reinsurance Review Required	System-generated guidance for next action.

8. Capacity & Reinsurance Recommendation Model

Condition	Recommended Action	Dashboard Message
Exposure within retention	Proceed within company capacity.	Within retention - no reinsurance action required.
Exposure exceeds retention but within treaty	Apply treaty reinsurance.	Treaty applicable - continue with treaty allocation.
Exposure exceeds treaty limit	Request facultative reinsurance.	Facultative reinsurance required before quote release.
High accumulation plus adverse claims	Escalate to Reinsurance Team and Senior UW.	Escalation required due to accumulation and loss indicators.
Deferred risk plus capacity breach	Block quote release until approval.	Deferred - capacity breach and risk acceptance exception pending.

- Use a capacity utilization gauge to show percentage consumed.
- Use layered bars to show retention, treaty and facultative layers.
- Show remaining capacity in value terms and not only as a percentage.
- Explain recommendation logic in plain language so users trust the system output.
- Track reinsurance approval as a dependency in the quotation progress tracker.

9. Quotation Progress Tracking & Next Best Actions

Status Color	Meaning	User Interpretation
Green	Completed	No action pending for this step.
Blue	Current / In Progress	This is the active step requiring attention.
Amber	Awaiting approval or clarification	Action is pending from another role or user.
Red	Blocked / Deferred	Case cannot proceed until issue is resolved.
Grey	Pending / Not Started	Future step not yet triggered.

Fresh Case Next Actions	Returning Case Next Actions
Complete missing occupancy details	Review changes from previous policy
Upload fire protection certificate	Validate increase in sum insured
Validate latitude and longitude	Check claims since last policy
Review claims declaration	Compare previous and current risk score
Check underwriting authority	Reconfirm accumulation exposure
Perform accumulation check	Review expiring reinsurance terms
Confirm reinsurance requirement	Approve renewal terms or escalate
Release quote to broker	Release renewal/revised quotation

10. Recommended Dashboard Layout

Recommended Screen Structure

Top: Case Type toggle, filters and KPIs. Middle: selected case workbench, workflow journey and next-best-actions. Lower: underwriting routing ladder, accumulation map and capacity/reinsurance recommendation. Bottom: missing information for Fresh Case or Previous vs Current comparison for Returning Case.

Screen Area	Component	Purpose
Top Bar	Case Type Toggle: Fresh Case / Returning Case	Changes workflow, tasks and context-aware panels.
KPI Row	Fresh Cases, Returning Cases, Preferred, Referred, Deferred, Pending UW, Capacity Utilization	Provides portfolio-level workload and risk view.
Case Workbench	Selected quote summary, risk category, SLA, assigned owner	Gives immediate case context.
Workflow Journey	Dynamic stepper based on case type	Shows progress and current step.
Next Best Actions	Task list driven by status and blockers	Tells the user exactly what to do next.
Routing Ladder	UW hierarchy and limits	Explains assignment and authority dependencies.
Accumulation Map	Lat/long exposure visualization	Shows concentration and hotspot risk.
Capacity & Reinsurance	Gauge, remaining capacity, recommendation card	Guides retention/treaty/facultative decision.
Bottom Intelligence Panel	Missing info or Previous vs Current comparison	Provides fresh-case completeness or returning-case change intelligence.

11. Suggested Dashboard Copy & Labels

Area	Suggested Label
Dashboard tagline	One view to classify, route, underwrite, monitor accumulation and release commercial quotations with full visibility.
Fresh Case panel	Complete the risk profile and validate exposure before quote release.
Returning Case panel	Focus on what changed, what worsened and what requires approval.
Routing explanation	Routed automatically based on risk category, sum insured, authority limit and accumulation exposure.
Reinsurance explanation	Recommendation generated based on retention, treaty limits, facultative threshold and remaining company capacity.
Progress tracker	Current step, pending dependencies and next actions are updated in real time.

12. Final UX Recommendation

- Add a prominent Fresh Case / Returning Case toggle so underwriters instantly know the workflow context.
- For Fresh Case, prioritize completeness, initial risk classification, authority routing and first-time capacity/reinsurance review.
- For Returning Case, prioritize previous vs current comparison, category movement, incremental exposure and reinsurance continuity.
- Make every system decision explainable: risk category, routing, capacity result and reinsurance recommendation should all show reason codes.
- Keep the next steps panel always visible so users are never unsure about how to progress the quotation.

Outcome

The proposed dashboard becomes both an operational workbench and an underwriting decision cockpit - helping teams move quotations faster while improving governance, capacity awareness and reinsurance control.
